

## MERMINN

Step 1 : Start

Step 2 : Declare the Variables

Step 3 : Read the size of first array

Step 4 : Read element of first array in sorted order.

Step 5 : Read the size of second array.

Step 6 : Read the element of second array in sorted order.

Step 7 : Repeat step 8 and 9 while  $i < m$  &  $j < n$

Step 8 : check if  $a[i] \geq b[j]$  then  $c[k++] = b[j++]$

Step 9 : else  $c[k++] = a[i++]$

Step 10 : Repeat step 11 while  $i < m$

Step 11 :  $c[k++] = a[i++]$

Step 12 : Repeat step 13 while  $j < n$

Step 13 :  $c[k++] = b[j++]$

Step 14 : Print the ~~first~~ array

Step 15 : Print the second array

Step 16 : Print the merged array

Step 17 : End

## STACK OPERATIONS

Step 1: Start

Step 2: Declare the node and the required variables.

Step 3: Declare the function for push, pop, display and search an element.

Step 4: Read the choice from user.

Step 5: If the user choose to push an element, then read the element to be pushed and call the function to push the element by passing the value to the function.

Step 5.1: Declare the newnode and allocate memory for the newnode

Step 5.2: Set newnode  $\rightarrow$  data = Value

Step 5.3: check if top == null then set newnode  $\rightarrow$  next = null

Step 5.4: Set newnode  $\rightarrow$  next = top

Step 5.5: Set  $top = newNode$  and then  
Print insertion is successful.

Step 6: If user choose to Pop an  
element from the stack then  
call the function to Pop the  
element.

Step 6.1: Check if  $pop == null$  then Print  
Stack is empty.

Step 6.2: Else declare a pointer variable  
temp and initialize it to top

Step 6.3: Print the element that being  
deleted.

Step 6.4: Set  $temp = temp \rightarrow next$

Step 6.5: Free the temp

Step 7: If the user choose the  
display then call the function  
to the element in the stack.

Step 7.1: Check if  $top == null$  then  
Print stack is empty.

Step 7.2: Else declare a pointer variable temp and initialize it to top.

Step 7.3: Print temp  $\rightarrow$  data.

Step 7.4: Set temp = temp  $\rightarrow$  next

Step 8: If user choose the search an element from the stack then call the function ~~the~~ to Search an element.

Step 8.1: Declare the pointer variable Ptr and other necessary variable.

Step 8.2: Initialize Ptr = top

Step 8.3: check if Ptr = null then print stack empty

Step 8.4: Else read the element to be searched

Step 8.5: Repeat Step 8.6 to 8.8 while Ptr  $\neq$  null

step 8.6: Check if  $Pte \rightarrow data == item$

then print element founded and  
to be located and set  $flag = 1$

step 8.7: Else set  $flag = 0$

step 8.8: Increment  $i$  by 1 and set  
 $Pte = Pte \rightarrow next$ .

step 8.9: Check if  $flag = 0$  then print  
the element not found.

step 9: End.

## CIRCULAR QUEUE OPERATION

Step 1: start

Step 2: Declare the queue and other variables.

Step 3: Declare the functions for enqueue, dequeue, search and display.

Step 4: Read the choice from the user.

Step 5: If the user choose for choice enqueue, then read the element to be inserted from the user & call the enqueue function by passing the value.

Step 5.1: Check if  $front == 1$  &  $rear == 1$  then set  $front = 0$ ,  $rear = 0$  and set  $queue[rear] = element$ .

Step 5.2: Else if  $rear + 1 \% max == front$  or  $front = rear + 1$  then Print Queue is overflow

Step 5.3: Else set  $rear = rear + 1 \% max$   
and set  $queue[rear] = element$

Step 6: If the user choice is the  
option dequeue then call the  
function dequeue.

Step 6.1: check if  $front == -1$  and  
 $rear == -1$  then Print queue  
is underflow.

Step 6.2: Else check if  $front == rear$   
then Print the element is  
to be deleted. Then set  
 $front = -1$  and  $rear = -1$

Step 6.3: Else Print the element to be  
dequeued set  $front = front +$   
 $1 \% max$ .

Step 7: If the user choice is to  
display the queue then call  
the function display.

Step 7.1: check if  $front = -1$  and  $rear = -1$   
then print queue is empty.

Step 7.2: Else repeat the step 7.3  
while  $i \leq rear$ .

5 Step 7.3: print  $queue[i]$  and set  
 $i = i + 1 \% more$ .

Step 8: If the user choose the search  
then call the function to search  
an element in the queue.

10 Step 8.1: Read the element to be  
searched in the queue

step 8.2: check if  $item == queue[i]$   
then print item found &  
its position and increment  
15  $i$  by 1.

Step 8.3: check  $c == 0$  then print  
item not found.

Step 9: End.

## DOUBLY LINKED LIST OPERATION

Step 1: Start

Step 2: Declare a structure and related variables.

Step 3: Declare functions to create a node, insert a node in the beginning, at the end and given position, display the list and search an element in the list.

Step 4: Define function to create a node, declare the required variables.

Step 4.1: Set memory allocated to the node = temp. then set temp → prev = null and temp → next = null

Step 4.2: Read the value to be inserted to the node.

Step 4.3: Set temp → n = data and increment count by 1.

step 5: Read the choice from the user to perform different operation on the list.

step 6: If the user choose to perform insertion operation at the beginning then call the function to perform the insertion.

step 6.1: Check if  $head == null$  then call the function to create a node, perform step 4 to 4.3.

step 6.2: Set  $head = temp$  &  $temp = head$

step 6.3: Else call the function to create a node, perform step 4 - 4.3 then set  $temp \rightarrow next = head$ , set  $head \rightarrow prev = temp$  and  $head = temp$ .

step 7: If the user choice is to perform insertion at the end of the list, then call the function to

perform the insertion at the end.

Step 7.1: check if  $head == null$  then call the function create a new node then set  $temp = head$  & then set  $head = temp$

Step 7.2: Else call the function to create a new node then set  $temp1 \rightarrow next = temp$ ,  $temp \rightarrow prev = temp1$  and  $temp1 \rightarrow prev = temp$

Step 8: If the user choose to perform insertion in the list at any position then call the function to perform the insertion operation

Step 8.1: Declare the necessary variable.

Step 8.2: Read the position where the node need to be inserted, set  $temp2 = head$

Step 8.3 : Checks if  $Pos < 1$  or  $Pos > Count + 1$  then print the position is out of range.

Step 8.4 : check if  $head == null$  &  $Pos = 1$  then print "Empty list cannot insert other than 1st position"

Step 8.5 : check if  $head == null$  &  $Pos = 1$  then call the function to create newNode, then set  $temp = head$  and  $head = temp$

Step 8.6 : while  $i < Pos$  then set  $temp2 = temp2 \rightarrow next$  then increment  $i$  by 1.

Step 8.7 : call the function to create a new node and then set  $temp \rightarrow Prev = temp2$ .  
 $temp \rightarrow next = temp2 \rightarrow next \rightarrow$   
 $Prev = temp$ .  
 $temp2 \rightarrow next = temp$ .

Step 9: If the user choose to perform deletion operation is the list then all the function to perform the deletion operation

5 Step 9.1: Declare the necessary variable.

Step 9.2: Read the position where node need to be deleted set temp = head

Step 9.3: check if  $pos < 1$  or  $pos \geq Count$ , then Print position out of range

10 Step 9.4: check if head == null then print the list is empty

Step 9.5: while  $i < pos$  then  $temp = temp \rightarrow next$  and increment  $i$  by 1

15 Step 9.6: check if  $i == 1$  then check if  $temp \rightarrow next == null$  then print node deleted free(temp) set  $temp = head = null$

Step 9.7: check if  $temp \rightarrow next == null$  then  $temp \rightarrow prev \rightarrow next = null$  then free(temp) then Print node deleted

Step 9.8:  $\text{temp2} \rightarrow \text{next} \rightarrow \text{prev} = \text{temp2} \rightarrow \text{prev}$   
 then check if  $i = 1$  then  $\text{temp2} \rightarrow$   
 $\text{prev} \rightarrow \text{next} = \text{temp2} \rightarrow \text{next}$

Step 9.9: check if  $i = 1$  then  $\text{head} = \text{temp2}$   
 $\text{next}$  then print node deleted  
 then free  $\text{temp2}$  and decrement  
 count by 1.

Step 10: If the user choose to perform  
 the display operation then call  
 the function to display the list

Step 10.1: Set  $\text{temp2} = \text{head}$

Step 10.2: check if  $\text{temp2} = \text{null}$  then Print  
 list is empty

Step 10.3: while  $\text{temp2} \rightarrow \text{next} \neq \text{null}$  then  
 Print  $\text{temp2} \rightarrow \text{data}$  then  $\text{temp2} =$   
 $\text{temp2} \rightarrow \text{next}$

Step 11: If the user choose to perform  
 the search operation then call  
 the function to perform search  
 operations

Step 11.1 : Declare the necessary variables

Step 11.2 : Set temp2 = head

Step 11.3 : Check if temp2 == null then  
Print the list is empty.

Step 11.4 : Read the value to be searched

Step 11.5 : While temp2 != null then check  
if temp2 → data == data then Print  
element found at position count  
+ 1

Step 11.6 : Else set temp2 = temp2 → next  
and increment count by 1

Step 11.7 : Print element not found in the  
list

Step 12 : End

## SET OPERATIONS

step 1: start

step 2: Declare the necessary Variable

step 3: Read the choice from user to perform set operation

step 4: If the user choose to perform union

step 4.1: Read the cardinality of 2 sets

step 4.2: Check if  $m = n$  then print cannot perform union

step 4.3: else read the elements in both the sets

step 4.4: Repeat the step 4.5 to 4.7 until  $i \leq m$

step 4.5:  $C[i] = A[i] \cup B[i]$

step 4.6: Print  $C[i]$

step 4.7: Increment  $i$  by 1

step 5: Read the choice from the user to perform intersection

step 5.1: Read the cardinality of 2 sets

step 5.2: check if  $m \geq n$  then print  
cannot perform intersection.

step 5.3: else read the elements in both  
the sets.

step 5.4: Repeat the step 5.5 - 5.7 until  
 $i < m$

step 5.5:  $C[i] = A[i] \cap B[i]$

step 5.6: Print  $C[i]$

step 5.7: increment  $i$  by 1

step 6: If the user chooses to perform  
set difference operation

step 6.1: Read the cardinality of 2 sets

step 6.2: Check if  $m \geq n$  then print  
cannot perform set difference  
operation

step 6.3: else read the elements in both  
sets

step 6.4: Repeat the step 6.5 - 6.8  
until  $i < n$

step 6.5 : check if  $B[i] == 0$  then  $C[i] = 0$

step 6.6 : Else if  $B[i] == 1$  then  $C[i] = 0$

step 6.7 : else  $C[i] = 1$

step 6.8 : Increment  $i$  by 1

5 step 7 : Repeat the step 7.1 and 7.2  
until  $i \leq m$ .

step 7.1 : print  $C[i]$

step 7.2 : Increment  $i$  by 1

step 8 : stop

10

15

## BINARY SEARCH TREE

step 1: start

step 2: Define a structure and structure pointer for insertion deletion and search operations and also declare a function for inorder traversal

step 3: Declare a pointer as root and also the required variable.

step 4: Read the choice from the user to perform insertion, deletion, searching and inorder traversal

step 5: If the user choose to perform insertion operation then read the value which is to be inserted to the tree from the user.

step 5.1: Pass the value to the insert pointer and also the root pointer.

step 5.2: check if !root then allocate memory for the root

step 5.3: Set the value to the info part of the root and then set left and right part of the root to null and return root.

step 5.4: check if  $\text{root} \rightarrow \text{info} > x$  then call the insert pointer to insert to left of the root.

step 5.5: check if  $\text{root} \rightarrow \text{info} > x$  then call the insert pointer to insert to the right of the root

step 5.6: Return the root

step 6: If the user choose to perform deletion operation then read the element to be deleted from the tree. ~~Pass~~ the root pointer

and the item to the delete pointer.

Step 6.1: Check if not  $ptr$  then print node not found

Step 6.2: else if  $ptr \rightarrow info < x$  then call delete pointer by passing the right pointer and the item.

Step 6.3: else if  $ptr \rightarrow info > x$  then call delete pointer by passing the left pointer and the item

Step 6.4: check if  $ptr \rightarrow info == item$  then check if  $ptr \rightarrow left == ptr \rightarrow right$  then free  $ptr$  and return null

Step 6.5: else if  $ptr \rightarrow left == null$  then set  $p1 = ptr \rightarrow right$  and free  $ptr$ , return  $p1$

Step 6.6 : else if  $p_{1x} \rightarrow \text{right} == \text{null}$  ,  
then set  $P_1 = p_{1x} \rightarrow \text{left}$  and  
free  $p_{1x}$ , return  $P_1$ .

Step 6.7 : Else set  $P_1 = p_{1x} \rightarrow \text{right}$  and  
 $P_2 = p_{1x} \rightarrow \text{left}$ .

Step 6.8 : while  $P_1 \rightarrow \text{left}$  not equal  
to null, set  $p_1 \rightarrow \text{left}$   $p_{1x} \rightarrow \text{left}$   
and free  $p_{1x}$ , return  $P_2$

Step 6.9 : Return  $p_{1x}$

Step 7 : If the user choose to perform  
search operation then call the  
pointer to perform search  
operation.

Step 7.1 : Declare the necessary  
pointer and variables.

Step 7.2 : Read the element to be  
searched

Step 7.3 : while  $p_{1x}$  check if  $\text{item} > p_{1x} \rightarrow$   
info then  $p_{1x} = p_{1x} \rightarrow \text{right}$

Step 7.4 : else if  $\text{item} < \text{ptr} \rightarrow \text{info}$   
then  $\text{ptr} = \text{ptr} \rightarrow \text{left}$

Step 7.5 : else break

Step 7.6 : check if  $\text{ptr}$  then print  
that the element is found

Step 7.7 : else print element not  
found in tree and return  
root.

Step 8 : if the user choose to  
perform traversal then call  
the traversal function and  
pass the root pointers.

Step 8.1 : If root not equals to  
null recursively call the  
functions by passing  
 $\text{root} \rightarrow \text{left}$

Step 8.2 : print  $\text{root} \rightarrow \text{info}$

Step 8.3 : call the traversal function  
recursively by passing

Root  $\rightarrow$  Right

Step 9 : Stop.

## DIS JOINT

step 1 : Start

Step 2 : Declare the structure and related structure variable

5 step 3 : Declare a function makeSet()

step 3.1 : Repeat step 3.2 - 3.4 until i < n

step 3.2 : dis.parent[x] is set to i

step 3.3 : Set dis.rank[x] is equal to 0

step 3.4 : Increment i by 1

10 step 4 : Declare a function display set

step 4.1 : Repeat step 4.2 and 4.3 until i < n

step 4.2 : Print dis.parent[i]

step 4.3 : Increment i by 1

15 step 4.4 : Repeat step 4.5 and 4.6 until i < n

step 4.5 : Print dis.rank[i]

step 4.6 : Increment i by 1

Step 5: Declare a function find and pass  $x$  to the function.

Step 5.1: check if  $\text{dis.parent}[x] = x$   
then set the return  
to  $\text{dis.parent}[x]$

Step 5.2: return  $\text{dis.parent}[x]$

Step 6: Declare a function union & Pass two variable  $x$  &  $y$

Step 6.1: set  $x$  set to  $\text{find}(x)$

Step 6.2: set  $y$  set to  $\text{find}(y)$

Step 6.3: check if  $x\text{set} == y\text{set}$   
then return.

Step 6.4: check if  $\text{dis.rank}[x\text{set}] < \text{dis.rank}[y\text{set}]$

Step 6.5: set  $y\text{set} = \text{dis.parent}[y\text{set}]$

Step 6.6: set  $-1$  to  $\text{dis.rank}[x\text{set}]$

Step 6.7: Else if check  $\text{dis.rank}[x\text{set}] > \text{dis.rank}[y\text{set}]$ .

step 6.8: Set x set to dis.parent[y set]

Step 6.9: Set -1 to dis.rank[y set]

Step 6.10: else dis.parent[y set] = x set

Step 6.11: Set dis.rank[x set] + 1 to  
dis.rank[x set]

Step 6.12: Set -1 to dis.rank[y set]

Step 7: Read the number of elements

Step 8: Call the function makeset

Step 9: Read the choice from user to  
perform union find and display  
operation.

Step 10: If the user choose to perform  
union operation read the  
element to perform union  
operations.

Step 11: If the user choose to  
perform find operation  
read the element to check if  
connected

step 11.1 : check if  $\text{find}(x) == \text{find}(y)$   
then print connected  
component

step 11.2 : else print not connected  
component.

step 12 : If the user choose to  
perform display operation  
call the function display  
set

step 13 : End.
